Step-by-Step Guide to Developing the ATM Java Mini Project

Creating an ATM mini project in Java involves systematic planning and implementation. Here's a step-by-step approach:

Step 1: Define the Project Structure
Create classes such as `Account`, `ATM`, and `Transaction`
Decide on data structures for storing accounts and transactions

Step 2: Design the Account Class
Attributes: accountNumber, PIN, balance, transactionHistory
Methods: deposit(), withdraw(), transfer(), getBalance()

```
javapublic class Account {private String accountNumber;private String PIN;private double balance;private List transactionHistory;// Constructor, getters, setters, and methods}
```

Step 3: Implement User Authentication
Prompt user for account number and PIN
Verify credentials before allowing access

```
javapublic boolean authenticate(String accountNumber, String PIN) {// Check if account exists and PIN matches}
```

Step 4: Create the ATM Class for Transaction Operations
Display menu options
Handle user choices and invoke account methods

```
javapublic class ATM {private Map accounts;public void displayMenu() {// Show options: Withdraw, Deposit, Balance, Transfer, Exit}}
```

Step 5: Implement Transaction Methods
`withdraw()`: Check balance, deduct amount
`deposit()`: Add amount to balance
`transfer()`:

Move funds between accounts
Record each transaction in history
Step 6: Add Transaction History and Exit
Store transaction logs for each account
Provide an option to view transaction history
Implement exit functionality to terminate the session
Step 7: Testing and Debugging
Test each functionality thoroughly
Handle exceptions like insufficient funds, invalid inputs
